What is Going on with the Global Forest?

What are the patterns of forest-covered areas in the World?
What are the main factors affecting deforestation?

Summary:

1. Some countries occupy more forested areas than the others: from 98.3% in Suriname to 0% in Oman.

2. However, the most of forests belong to large countries, of which Russia is by far the forest-richest one, owing 21% of the World forest, followed by Brazil, Canada, United States, and China.

3. Of the top World forest contributors, a worrying trend of deforestation is seen for Brazil, Democratic Republic of the Congo, and Indonesia. Interestingly, China has been gradually increaseng its forested territories over the last 10 years, with over 10% forest gain in 2021 compared to 2010.

4. The trends in changes of forest areas do not seem to be related to the growth of the density of the country population, as this growth is observed in all the top forest countries.

5. The % of areas covered by forest seem to inversely correlate to the % of agricultural lands (after exclusion naturally deserted or iced land countries).

6. Canada, Indonesia, and Russia are the top World wood exporters (in $US). Of these forestry was the most important driver of deforestation in Canada, Followed by Russia and Indonesia.
